

IN THE CLAIMS

1. (Currently Amended) A tri-panel binder clip sleeve adapted to secure indicia to a binder clip, in combination with a binder clip comprising:

- ~~the binder clip comprising first and second jaw portions, a connecting spine portion therebetween and an outer surface along each of the jaw and spine portions, the binder clip further having a handle secured to each of the jaw portions such that pressing together of the handles separates the jaw portions, the tri-panel binder clip sleeve comprising:~~
- a binder clip having:
 - a spine;
 - first and second jaw portions connected to opposite end portions of the spine integral therewith, the jaw portions each having a tip resiliently biased into abutment with the other tip;
 - an outer surface along each of the jaw portions and spine; and
 - a handle secured to each of the jaw portions such that pressing together of the handles separates the tips; and
- a tri-panel binder clip sleeve attached to the binder clip having:
 - a first panel in overlying relationship with the first jaw portion outer surface, said first panel having an outwardly-facing surface for displaying indicia located thereon;
 - a second panel in overlying relationship with the second jaw portion outer surface, said second panel having an outwardly-facing surface for displaying indicia located thereon;
 - a third panel spaced between and connecting the first and second panels, the third panel being in overlying relationship with the spine portion and having an outwardly-facing surface for displaying indicia located thereon;

- at least the first and second panels are being secured to the respective jaw portion such that the tri-panel binder clip sleeve is held in place on the binder clip and the handles are uncovered by the tri-panel binder clip sleeve; and
- indicia on at least one of the panels.

2. (Original) The tri-panel binder clip sleeve of claim 1 wherein:

- the jaw and spine portion outer surfaces each have an area defined by length and width dimensions; and
- the first, second and third panels each have an area substantially congruous with the respective jaw and spine portion outer surfaces.

3. (Original) The tri-panel binder clip sleeve of claim 1 wherein the tri-panel binder clip sleeve is a unitary member.

4. (Original) The tri-panel binder clip sleeve of claim 3 wherein the tri-panel binder clip sleeve is self-supporting.

5. (Original) The tri-panel binder clip sleeve of claim 4 wherein the first, second and third panels are sized such that the tri-panel binder clip sleeve is in frictional engagement with the binder clip.

6. (Original) The tri-panel binder clip sleeve of claim 5 wherein the tri-panel binder clip sleeve comprises a material selected from the group consisting of plastic, acrylonitrile butadiene styrene, acrylic, polyethylene, melamine, polyvinyl chloride, styrene, vinyl, LEXAN, polyethylene, brass and aluminum.

7. (Previously Presented) The tri-panel binder clip sleeve of claim 1 wherein:

- the tri-panel binder clip sleeve comprises a foldable substrate;
- the first, second and third panels each have an inwardly-facing surface;
- an adhesive is located on at least portions of the first and second panel inwardly-facing surfaces; and
- the adhesive secures the tri-panel binder clip sleeve in engagement with the binder clip.

8. (Original) The tri-panel binder clip sleeve of claim 7 wherein the foldable substrate comprises paper.

9. (Original) The tri-panel binder clip sleeve of claim 7 wherein the foldable substrate is made of a material selected from the group comprising paper, mylar and polyethylene film.

10. (Original) The tri-panel binder clip sleeve of claim 7 wherein the jaw and spine portion outer surfaces each have an area defined by length and width dimensions and the foldable substrate is pre-formed such that the first, second and third panels each have an area substantially congruous with the respective jaw and spine portion outer surfaces.

11. (Original) The tri-panel binder clip sleeve of claim 10 wherein the adhesive is located on substantially all of the first, second and third panel inwardly-facing surfaces.

12. (Original) The tri-panel binder clip sleeve of claim 7 wherein the tri-panel binder clip sleeve further includes a fold line between each of the first and third and second and third panels to facilitate engagement of the panels with the binder clip.

13. (Original) The tri-panel binder clip sleeve of claim 7 wherein the tri-panel binder clip sleeve further includes a perforation line between each of the first and third and second and third panels to facilitate engagement of the panels with the binder clip.

14. (Original) The tri-panel binder clip sleeve of claim 1, further including a light-transmissive sleeve element located over the binder clip sleeve.

15. (Currently Amended) A tri-panel binder clip sleeve adapted to be secured over a binder clip, in combination with a binder clip comprising: said binder clip having first and second jaw portions, a spine portion therebetween and an outer surface having an area defined by length and width dimensions along each portion, said binder clip further having an axis and a generally triangular structure in a section transverse to the axis and a handle secured to each of the jaw portions such that pressing together of the handles separates the jaw portions, the tri-panel binder clip sleeve comprising:

- a binder clip including:
 - a spine;
 - first and second jaw portions connected to opposite end portions of the spine integral therewith, the jaw portions each having a tip resiliently biased into abutment with the other tip;
 - an outer surface along each of the jaw portions and spine; and
 - a handle secured to each of the jaw portions such that pressing together of the handles separates the tips; and
- a unitary, self-supporting sleeve element including:
 - a first panel configured for overlying relationship with the binder clip first jaw portion outer surface, said first panel having an outwardly-facing surface for displaying indicia located thereon;

- a second panel configured for overlying relationship with the binder clip second jaw portion outer surface, said second panel having an outwardly-facing surface for displaying indicia located thereon; and
- a third panel spaced between and connecting the first and second panels, the third panel being configured for overlying relationship with the spine portion outer surface and having an outwardly-facing surface for displaying indicia located thereon; and
- indicia on at least one of the panels;
- said unitary, self-supporting sleeve element being structured such that the first, second and third panels each have an area substantially congruous with the respective jaw and spine portion outer surfaces, and, collectively, are configured and arranged to fit over the binder clip structure without covering the handles.

16. (Cancelled)

17. (Original) The tri-panel binder clip sleeve of claim 15 wherein the first, second and third panels are sized such that the tri-panel binder clip sleeve is in frictional engagement with the binder clip.

18. (Original) The tri-panel binder clip sleeve of claim 17 wherein the tri-panel binder clip sleeve comprises a material selected from the group consisting of plastic, acrylonitrile butadiene styrene, acrylic, polyethylene, melamine, polyvinyl chloride, styrene, vinyl, LEXAN, polyethylene, brass and aluminum.

19. (Previously Presented) The tri-panel binder clip sleeve of claim 15 wherein:

- the first, second and third panels each have an inwardly-facing surface; and
- an adhesive is located on at least portions of the first, second and third panel inwardly-facing surfaces.

20. (Original) The tri-panel binder clip sleeve of claim 15 wherein the tri-panel binder clip sleeve further includes a transition portion between each of the first and third and second and third panels to facilitate engagement of the panels with the binder clip.

21. (Original) The tri-panel binder clip sleeve of claim 15 wherein the indicia are raised or indented elements proximate the panels.

22. (Original) The tri-panel binder clip sleeve of claim 15, further including a light-transmissive sleeve element located over the binder clip sleeve.

23. (Currently Amended) A method of affixing indicia to a binder clip, said binder clip having a spine portion, first and second jaw portions connected to opposite ends of the spine portion integral therewith, the jaw portions each having a tip resiliently biased into abutment with the other tip, an outer surface along each of the jaw portion and spine portions, and a handle secured to each of the jaw portions such that pressing together of the handles separates the jaw portions tips, the method comprising:

- affixing indicia directly to a tri-panel binder clip sleeve, said sleeve having [[a]] first and second panel panels each structured for overlying engagement with to overlie the binder clip spine portion and second and third panels structured for overlying engagement, each with one of the binder clip jaw portions, and a third panel structured to overlie the binder clip spine portion, said tri-panel binder clip sleeve

being further structured such that at least the first and second ~~and third~~ panels are secured to the respective jaw portion to hold the panel binder clip sleeve in place on the binder clip without covering the handles; and

- affixing the tri-panel binder clip sleeve to the binder clip.

24. (Previously Presented) The method of claim 23 wherein the binder clip sleeve first, second and third panels are structured to frictionally engage the binder clip and the affixing step comprises the step of sliding the binder clip sleeve over the binder clip.

25. (Previously Presented) The method of claim 23 wherein the binder clip sleeve first, second and third panels each have an inwardly-facing surface and an adhesive located on at least a portion of the inwardly-facing surfaces and the affixing step comprises the step of adhering the binder clip sleeve to the the binder clip.

26. (Previously Presented) The method of claim 23 further including the step of placing a light-transmissive sleeve element over the binder clip sleeve.

27. (Previously Presented) A tri-panel binder clip sleeve adapted to secure indicia to a binder clip in combination with a binder clip comprising: [[, the]] a binder clip comprising having: a spine portion; first and second jaw portions, a connecting spine portion therebetween connected to opposite ends of the spine portion integral therewith, the jaw portions each having a tip resiliently biased into abutment with the other tip; and an outer surface along each of the jaw and spine portions; and spine portions, the binder clip further having a handle secured to each of the jaw portions such that pressing together of the handles separates the jaw portions, tips; and the tri-panel binder clip sleeve comprising having: first, second and third panels in respective overlying relationship with the binder clip first and second jaw portions and spine portion such

that at least the first and second panels are secured to the respective jaw portion to hold the tri-panel binder clip sleeve in place on the binder clip without covering the handles, each of said panels having an outwardly-facing surface capable of displaying indicia located thereon; and indicia on at least one of the panels.

28. (Previously Presented) The tri-panel binder clip sleeve of claim 27 wherein:

- the jaw and spine portion outer surfaces each have an area defined by length and width dimensions; and
- the first, second and third panels each have an area substantially congruous with the respective jaw and spine portion outer surfaces.

29. (Previously Presented) The tri-panel binder clip sleeve of claim 27 wherein the tri-panel binder clip sleeve is a self-supporting unitary member.

30. (Previously Presented) The tri-panel binder clip sleeve of claim 29 wherein the first, second and third panels are sized such that the tri-panel binder clip sleeve is in frictional engagement with the binder clip.

31. (Previously Presented) The tri-panel binder clip sleeve of claim 27 wherein the tri-panel binder clip sleeve comprises a foldable substrate, the first, second and third panels each have an inwardly-facing surface and an adhesive secures the tri-panel binder clip sleeve to the binder clip.

32. (Previously Presented) The tri-panel binder clip sleeve of claim 31 wherein the foldable substrate comprises paper.

33. (Currently Amended) The tri-panel binder clip sleeve of claim 31 wherein the foldable substrate is made of a material selected from the group consisting of mylar and ~~poyethylene~~ polyethylene film.

34-35. (Cancelled)
